

Your Self-Introduction

Human, natural, and made for you - to say in your own voice

Read this first

Your introduction is the first 60 seconds, and it sets the whole tone. Here's the honest truth about it: **the words matter less than sounding like a real person.** A slightly imperfect intro said warmly beats a polished one recited like a robot. Interviewers have heard a hundred memorised speeches this week - the moment you sound rehearsed, they stop listening.

So these are **not scripts to memorise.** They're the shape of what to say. Read one, close the file, and say it in your own words, out loud, a few times, until it feels like *you talking*, not you reciting. Change my sentences. Use your own. Keep the thread, drop the polish.

Three things that make an intro sound human:

- **Talk, don't list.** "I built an emergency app that's live" beats "My skills include React Native, Django, PostgreSQL."
- **Say one thing you actually care about.** A genuine line about *why* you love building lands harder than any skill.
- **Breathe and smile.** Pauses are human. Rushing to fit everything in is what makes people sound nervous and scripted.

Wherever you see [**your words**], that's where your own real detail goes - don't use mine, use yours.

The core of who you are (your raw material)

Before the versions, here's your story in plain terms - so you can rebuild the intro any way you like:

- Final-year Computer Science student at Amity University Kolkata.
- You don't just study software - you **build and run real products**. The big one is DokLink, an emergency healthcare app for finding and booking hospital beds in real time, where you're the sole developer and CTO - app, backend, and the server it runs on.
- You've built other real things: e-commerce sites, an AI system that answers questions about ocean data in plain English, a workflow tool for a factory, a B2B business platform.
- You co-authored two research papers on how pedestrians interact with self-driving cars.
- You even built your own small programming language once, for the fun of understanding how they work.
- You're most comfortable in JavaScript, TypeScript, Python, and C++, and you've taught yourself most of it by building.
- What genuinely excites you: going from building things alone to learning how huge, enterprise systems are engineered by real teams.

Everything below is just different ways of telling *that*.

Version 1 - Technical round

Lead with what you build. Keep it about 45-60 seconds.

“Good morning. I’m Nirmalya, a final-year Computer Science student at Amity University Kolkata.

The short version of me is that I love building things and actually shipping them - not just writing code for assignments, but taking something all the way to real users. The project I’m proudest of is DokLink, an emergency app that helps people find and book a hospital bed in real time during a medical emergency. I built the whole thing - the mobile app, the backend, and the server it runs on - and I basically run it as the tech lead.

Along the way I’ve built a few other real products - an e-commerce site, an AI tool that answers questions about ocean data in plain English, and a couple of client platforms. I’m most comfortable with JavaScript, TypeScript, and Python, and honestly I’ve taught myself most of my stack by just building something and figuring it out.

What pulls me toward this role is that I’ve mostly worked alone on small things, and I really want to learn how large, enterprise-scale systems are built by proper teams. That’s the part I’m excited about.”

Why this works: it opens with a genuine feeling (“I love building things”), names a concrete shipped product they’ll want to ask about, stays honest about your stack, and ends on the learning attitude SAP wants.

Version 2 - Managerial / HR round

Here, shift from *what* you build to *how you work and who you are*. Same length.

“I’m Nirmalya, a final-year CS student, and if I had to sum myself up, I’d say I’m someone who likes taking full ownership of things.

At DokLink I’m basically the whole tech team - I own the product from the first idea to the live server - and that’s taught me to be organised, to prioritise hard, and to keep something reliable when I’m the only one keeping it alive. I’ve also worked with founders and designers on client projects and with a team on two research papers, so I’m comfortable both working independently and collaborating.

Outside of that, I’m just genuinely curious - I taught myself most of what I know because a project needed it, and I even built my own little programming language once just to understand how they work under the hood.

What draws me to SAP and the STAR program is that it’s built around exactly how I grow best - real work, real responsibility, and structured learning at the same time. That’s the environment where I do my best work.”

Why this works: it leads with a character trait (ownership), backs it with proof, shows you can also work in a team, adds a genuinely human touch (the curiosity, the language project), and bridges naturally into “Why STAR.”

Version 3 - The 20-second version

Sometimes they just want a quick one, or you need a fallback. Have this ready:

“I’m Nirmalya, a final-year CS student from Kolkata. I’m a full-stack developer, but more than that, I actually build and run real products - including an emergency healthcare app that I built end to end and run as the tech lead. And I’m here because I really want to learn how enterprise-scale software is built.”

Make it yours - the personal touch

The versions above are honest but safe. To make yours genuinely *you*, add one real, human detail somewhere. Pick something true:

- **Why you got into coding.** [your words - a genuine reason, even a small one. “I got hooked when I built my first thing that actually worked and someone used it.”]
- **A non-tech side to you.** [your words - a hobby, a sport, something you enjoy. This makes you relatable, not just impressive.]
- **What building means to you.** [your words - the feeling you get from shipping something real.]

Even one honest sentence like this is what separates a human intro from a corporate one. It doesn't have to be clever - it has to be true.

Delivery - how to actually say it

- **Don't memorise word for word.** Learn the *beats* (who I am -> what I build -> a proof -> why I'm here) and let the words come fresh each time. That's what keeps it natural.
 - **Slow down.** Nervousness makes people rush. A calm pace sounds confident.
 - **Pause after your hook.** After "an emergency app that I built end to end," pause. Let it land. Let them want to ask about it.
 - **Smile at the start.** It changes your voice, and it changes how they receive you.
 - **Aim to *end*, not to fit everything in.** It's fine to leave things out - they'll ask. A short, warm intro beats a long, breathless one.
-

What your intro sets up (the questions it invites)

A good intro plants hooks. Yours plants these - and you're ready for all of them:

- “Tell me about DokLink.” -> your flagship story (see the DokLink report)
- “You’re the CTO / tech lead as a student?” -> the honest CTO playbook (projects doc)
- “What’s this AI ocean-data project?” -> FloatChat, your SAP-Joule bridge
- “You built your own language?” -> the CONTEXT interpreter, pure fundamentals
- “Why do you want to learn enterprise systems?” -> straight into Why SAP / Why STAR

Say your intro, pause, and let them pull the thread. That’s you leading the interview - exactly like the seniors said.

One last thing

You have a genuinely strong, real story - a student who builds and ships things most people only talk about. You don't need to inflate any of it or perform. Walk in, be warm, tell the truth about what you've built, and let your actual work do the work. That's the most human - and most convincing - thing you can do.
